Supplement Fig. 2. Time-dependent receiver operating characteristic (ROC) curves for predicting addition of anastrozole to clomiphene therapy at 24 months based on (A) baseline estradiol and (B) body mass index (BMI). (A) Optimal cut-point (after adjusting for baseline total testosterone and BMI) = 18.5 pg/mL; area under the curve (AUC) = 0.73, 95% confidence interval (CI) = 0.66–0.80. (B) Optimal cut-point (after adjusting for baseline total testosterone and estradiol) = 29.0 kg/m²; AUC = 0.70, 95% CI = 0.63–0.78.
